

MATH 10B – Spring 2019
Quiz 13 – Prepared by John Yirong Zhen
Date:04/30/2018

You are to finish this quiz in 10 minutes. You are allowed one single-sided letter-size cheat sheet. No calculators or other notes/books/devices are allowed.

Your cheatsheet must be handwritten by you, no photocopying or preprinted (unless you have written permission from the instructor). Try your best! Stay calm and good luck!

I. True/False (2 pts)

Circle T or F in the space provided in front of the statement to indicate whether it is true or false respectively. You get +1 for a correct answer, -1 for incorrect, and 0 for leaving it blank. (You should not guess if you don't know the answer.)

You do not need to justify your answers for T/F statements.

- T ☐ All Chi-square distributions are symmetric around zero.
The domain of Chi-square distributions are all non-negative numbers and therefore can't be symmetric.
- ☐ F If the critical value for the χ^2 distribution with k degrees of freedom is r , then $P(R \geq r) = \alpha$.

II. Written problems (10pts)

- You **MUST justify your answer** to undoubtably convince me that you solved and not guessed it. Partial credit will be given to good work and progress even if there is no final answer or the answer is incorrect. On the other hand, bogus justification for a correct answer will receive a 0.
- Keep your scratch work separate. Cross out writing you don't want to be graded and clearly label the parts you want to be graded.
- Points will be deducted for incorrect writings that you "forget to cross out."

See problem on back.

You roll a die 60 times and get 10 1's, 10 2's, 8 3's, 3 4's, 7 5's, and 22 6's. Is the die fair? Use the significance level $\alpha = 0.05$. Define the null and alternative hypothesis, perform a χ^2 test and draw a conclusion.

H_0 : The die is fair.

H_1 : The die is not fair.

$$r = \sum_{k=1}^6 (n_k - m_k)^2 / m_k = 0 + 0 + 0.4 + 4.9 + 0.9 + 14.4 = 20.6.$$

We have $6 - 1 = 5$ degrees of freedom.

Using the χ^2 table, the critical χ^2 value is 11.07. Thus, since $20.6 > 11.07$, we reject H_0 in favor of H_1 i.e. we conclude that the die is not fair.
